

PUMP SURVEY

The Pump Apps Pump Survey is an essential service offering to all our valued customers. In any production environment, a periodic audit of pumps and pump systems, with consequential improvements of pump systems, is a critical exercise: starting with mapping of pumps and finishing with evaluation of the efficiency of the pump system as a whole.

In our interactions with maintenance managers and plant engineers, we've found that almost everyone expresses similar challenges, like long lead times to resolve breakdowns, getting pumps and spares on time, delays in assessing the causes of breakdowns, delays with the collection of faulty pumps for assessment and repair and getting the right OEM parts at the right time for the right price.

We believe that a proactive approach is required to overcome these and other challenges.

Our recommended starting point at the Pump Apps is our invaluable Pump Survey. This survey is undertaken by our experienced staff in conjunction with your artisans and/or maintenance representatives. The aim of the survey is to gather information that includes, amongst others, pump type, brand, and model, wear parts, service parts, cost, projected replacement cost, compatible replacement brands and models, etc (see diagram - illustrating a summarized overview of our approach and methodology).

The diagram above illustrates our process, from consultation your key personnel to the mapping of pumps, to technical inspections, to the plotting of data as well as consultation with your stores. This process culminates in a range of management reports that can be tailored to your specific needs.
